

Air compressor oil and gas separator manufacturer

Why should you use an air/oil separator?

This ensures that oil consumption in the compressors and oil entrainment into the compressed air networks are kept to a minimum. Oil vapor is not separated. Air/oil separators can be used with all types of standard compressor lubricating oils, irrespective of whether they are mineral-based, synthetic, or partially synthetic products.

What is an air compressor oil separator?

An air compressor oil separator is a key component in determining the air quality within a compressed air system. Oil, if able to get down your lines and reach your pneumatic tools, may cause serious damage and reduce your tools lifespan. Below we will take a look at oil separators: what they are, how they work and where you can find them!

What is a pleated air-oil separator?

A Pleated Air-Oil Separator can be suited for approximately 2x the air flow capacity as that of a standard air-oil separator. The Chicopee separator design utilizes a unique media configuration and innovative structural integrity components to achieve exceptionally efficient oil removal.

How do air/oil separators work?

In the standard design of air/oil separators, oil flows from the outside to the inside and the drainage oil is drawn off on the dry side through a centrally positioned pipe running from the base cup of the separator. This product family is suitable for flow from the outside to the inside.

What is a conventional oil separator?

The standard conventional oil separator is the original design for the removal of oil aerosols from the compressed air stream. This element design consists of a specific amount of a uniform grade of borosilicate glass fibers, "wrapped" onto a support tube.
