What is an oil injected rotary screw air compressor?

The oil injected rotary screw air compressor is a versatile industrial machinery that efficiently converts power into compressed air through a continuous rotary motion. Commonly known as a twin-screw compressor (figure 1), this type of compressor consists of two rotors, each featuring a set of helical lobes attached to a shaft.

How does a screw compressor work?

As can be seen on the picture: air gets sucked in on one side (cold, low pressure), gets trapped between the rotors, and is discharged on the other side (hot, high pressure). This compression requires power, which is usually supplied by a big electric motor. There are two basic types of screw compressor: oil-injected and oil-free.

Is a rotary screw compressor a positive displacement compressor?

The rotary screw compressor is a 'positive displacement' compressor. Which simply means that the air is physically squeezed together by an external force (like piston- and scroll-compressors, which are also positive displacement compressors). Trapped air between the rotors

What is the screw element in a rotary screw air compressor?

The screw element is the most important part of any screw-type compressor. It's that part of the machine where the actual compression takes place. It is the heart of the rotary screw air compressor. Often, the compressor screw element is also called air-end. They are constant flow (volume) with variable pressure compressors.

What is a rotary screw air compressor?

A rotary screw air compressor is one of the two types of positive displacement gas compressors. It uses two rotors to create the pressure needed for air compression. They are one of the easiest types of air compressors to use and maintain. The other type of positive displacement compressor is the reciprocating or piston compressor.

How do you attach a screw compressor to a skid?

Use I beams in the skid where the screw compressor will be attached to the system base. The I beams should run parallel to the package feet and support the feet for their full length. The compressor unit feet should be continuously welded to the system base at all points of contact.
